### **1.0 Introduction**

Level III data validation was performed on 100% of the environmental samples collected at Parcel PPMP-233. The analytical data consisted of five sample delivery groups (SDG), PK723301 through PK723305 (note: PK723303 was not validated since it contained field QC data only, i.e. trip and equipment blanks), which were analyzed by Quanterra Incorporated. In addition, an evaluation of the field split data, which was analyzed by the USACE-SAD laboratory, is included in this report. The chemical parameters for which the samples were analyzed, are identified below:

Parameter (Method)
Volatile Organic Compounds by SW 846 8260B
Semivolatile Organic Compounds by SW 846 8270C
TAL Metals by SW 846 6010B/7470
Organochlorine Pesticides by SW 846 8081A
PCBs by SW 846 8082
Chlorinated Herbicides by SW846 8151
Nitroaromatics and Nitramines by SW 846 8330

### **2.0 Procedures**

The sample data were validated following the logic identified in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines For Inorganic Data Review (February 1994) and USEPA Contract Laboratory Program National Functional Guidelines For Organic Review (October 1999) for all areas except Blanks. Region III Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses (April 1993) and Region III National Functional Guidelines for Organic Data Review (June 1992) were applied to the areas associated with blank contamination. Specific quality control (QC) criteria, as identified in the Quality Assurance Plan (QAP), analytical methods, and laboratory Standard Operating Procedures (SOP's) were applied to all sample results. As the result of the use of Update III SW846 test methods for the analytical data and the application of the CLP guidelines during the validation process, there were instances where specific QC requirements for all target compounds were not defined. This primarily occurred in the organic, Gas Chromatograph (GC) and Gas Chromatograph/Mass Spectra (GC/MS) calibration areas and is due to the fact that the analytical methods are "performance-based", and allows the use of average calibration responses, in lieu of, individual responses, which are defined by CLP protocol. In light of applying CLP guidelines to SW846 methods and evaluating the usability of the data during the validation process, specific QC

criteria were determined to address all target compounds and are identified in this report for each parameter, as well as, in the validation checklists, which function as worksheets. All completed validation checklists are on file in the Knoxville office. For those analytical methods not addressed by the CLP and Region III guidelines, the validation was based on the method requirements (i. e. SW846, CFR, SOP's) and technical judgement, following the logic of the CLP validation guidelines.

### ***3.0 Summary of Data Validation Findings***

The overall quality of the data was determined to be acceptable. The only rejected data ('R' qualified) was due to "poor performing" volatile compounds (ketones, some halogenated hydrocarbons, e.g.), which exhibited poor calibration responses in the associated calibration data, and samples that were reanalyzed and have more than one result reported. The R qualifier was assigned to the samples with more than one set of results to indicate that a given result should not be used to characterize a particular constituent or an analysis for a given sample.

Individual validation reports have been prepared for each parameter and the overall results of the validation findings are summarized in this report. The validation qualifier data entry verification report (Attachment A) is also provided. This is a complete listing of all of the analytical results and the validation qualifiers assigned for Parcel PPMP-233. It also identifies the 'use' column, which indicates which result to use in the event of a reanalysis. A listing of the validation qualifiers and the reason codes, along with their definitions are also found in Attachment A. The following section highlights the key findings of the data validation for each analysis.

**Bold Print** = Results detected below the reporting limit.

**Metals:** Majority of the same metals were detected in all three samples. The RPD's were high for some compounds. The differences could be attributed to lack of homogeneity in soil samples and/or sampling activities.

**Volatiles:** No volatiles detected in the FS. Methylene chloride, a common laboratory contaminant, and 1,1,1-Trichloroethane, were detected below the reporting/quantitation limit in the original and FD. Acetone was also detected in the original and FD and not detected in the FS. It should be noted that acetone results for the original and FD are reported at a dilution since the original analysis exceeded the instrument calibration range.

**Semivolatiles:** No semivolatiles detected in the FS. Bis(2-Ethylhexyl)phthalate, a common laboratory contaminant and Benzo(ghi)perylene, were detected below the reporting/quantitation limit in the original and/or FD.

**Pesticides, OP Pesticides, PCB's, Herbicides:** No compounds were detected in the original, FD or FS samples.

## **ATTACHMENT A**

## **Validation Qualifiers**

- U** Not detected. The compound/analyte was analyzed for, but not detected above the associated reporting limit.
- J** The compound/analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed.
- B** The concentration reported was detected significantly above the levels reported in the associated equipment rinse samples and/or laboratory method and trip blanks. (5X/10X Rule was applied).
- R** The reported sample results are rejected due to the following:
  1. Severe deficiencies in the supporting quality control data.
  2. Anomalies noted in the sampling and/or analysis process which could affect the validity of the reported data.
  3. The presence or absence of the constituent cannot be verified based on the data provided.
  4. To indicate not to use a particular result in the event of a reanalysis.
- UJ** The compound/analyte was analyzed for, but not detected above the established reporting limit. However, review and evaluation of supporting QC data and/or sampling and analysis process have indicated that the "nondetect" may be inaccurate or imprecise. The nondetect result should be estimated.
